Economic benefits of multi-brand platooning

François Combes, El-Mehdi Aboulkacem

Univ. Gustave Eiffel

Focus on Economic Benefits

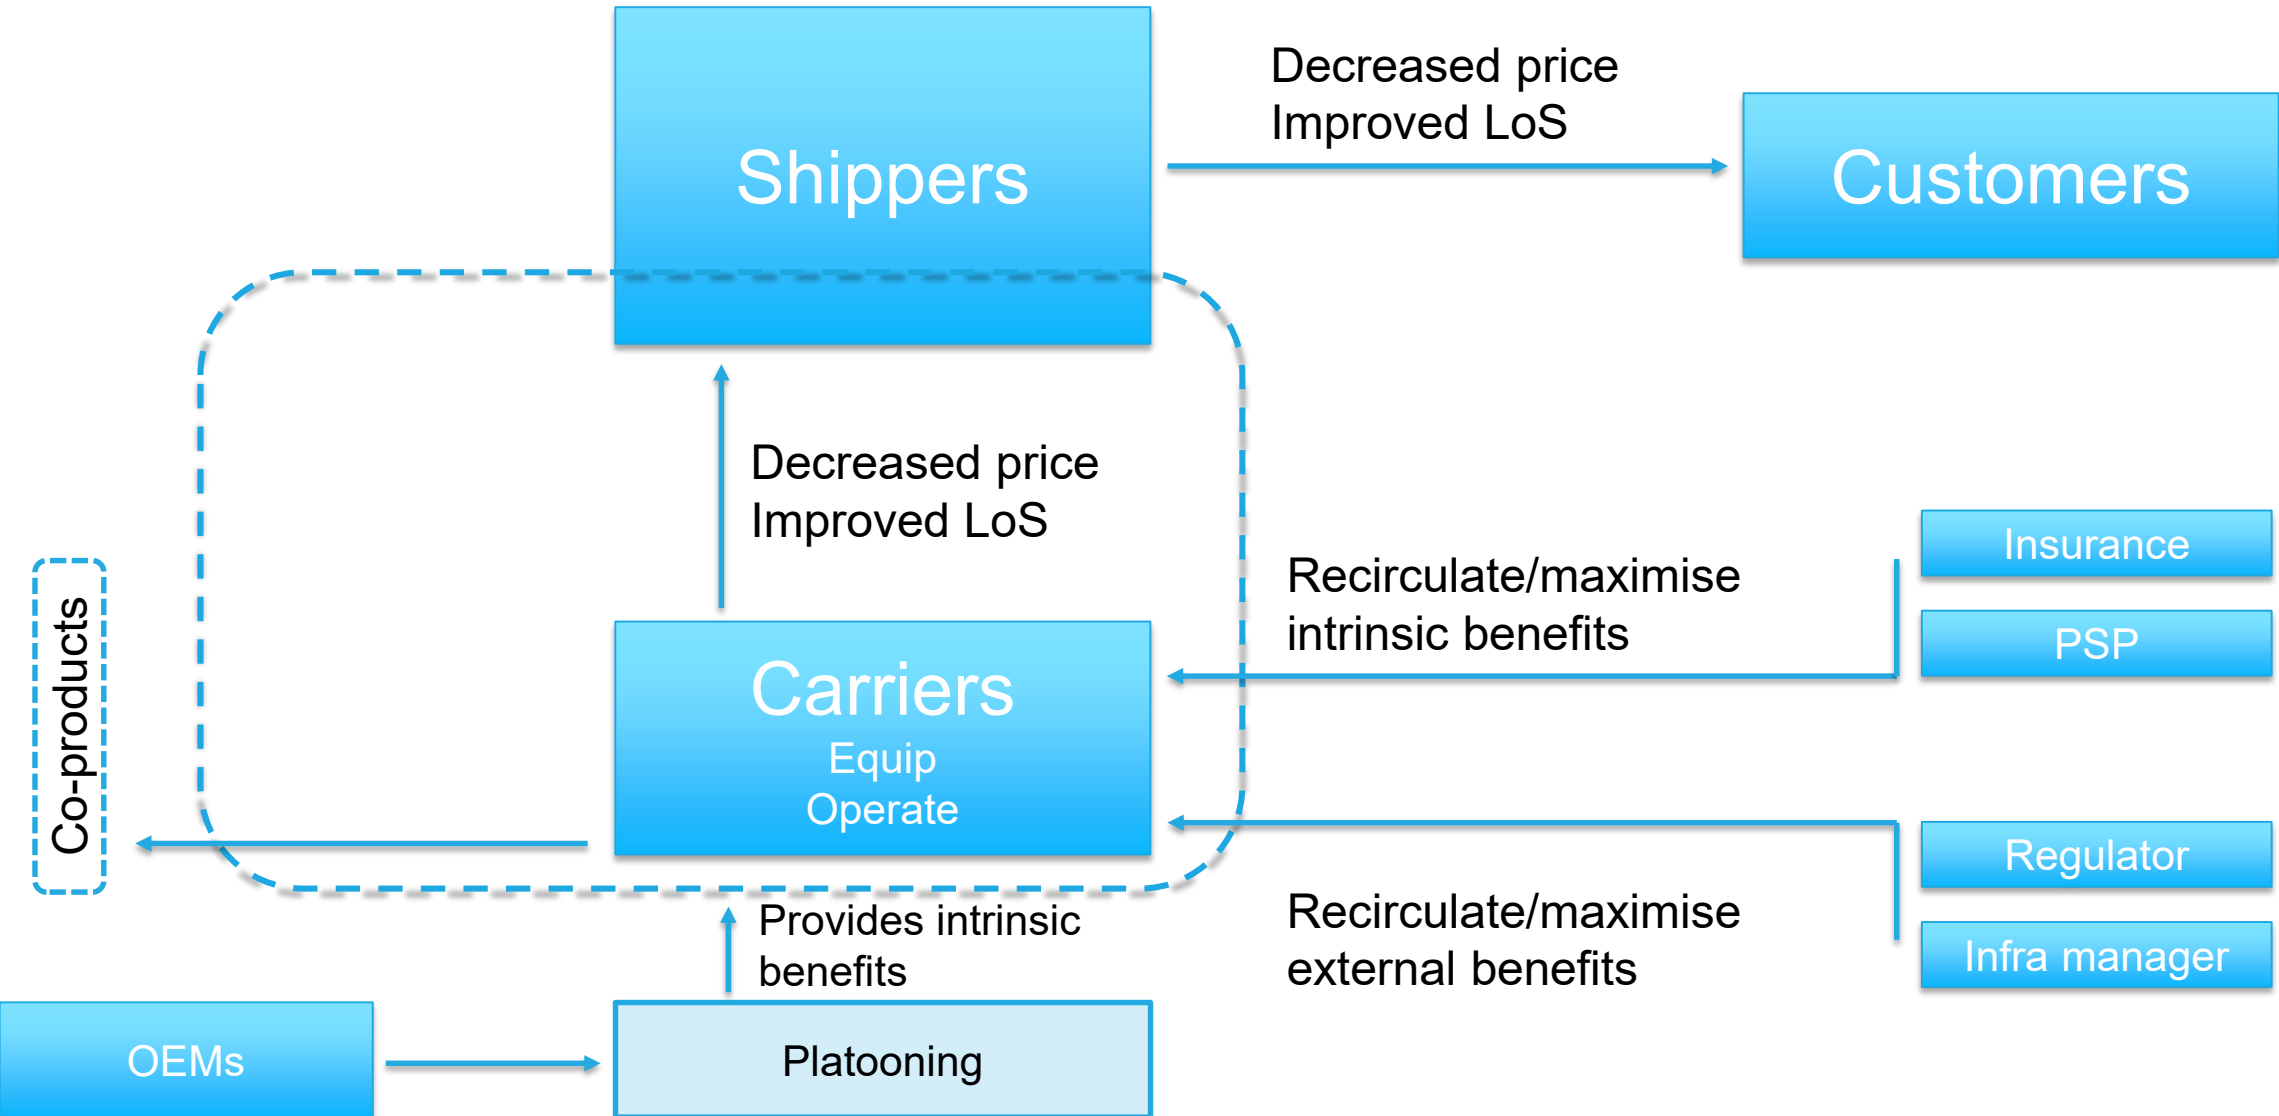

- Questions
 - What is the core value of multi-brand platooning?
 - What is the predictable market uptake of the multi-brand platooning technology?
 - What are the external impacts of multi-brand platooning?

Core value of platooning

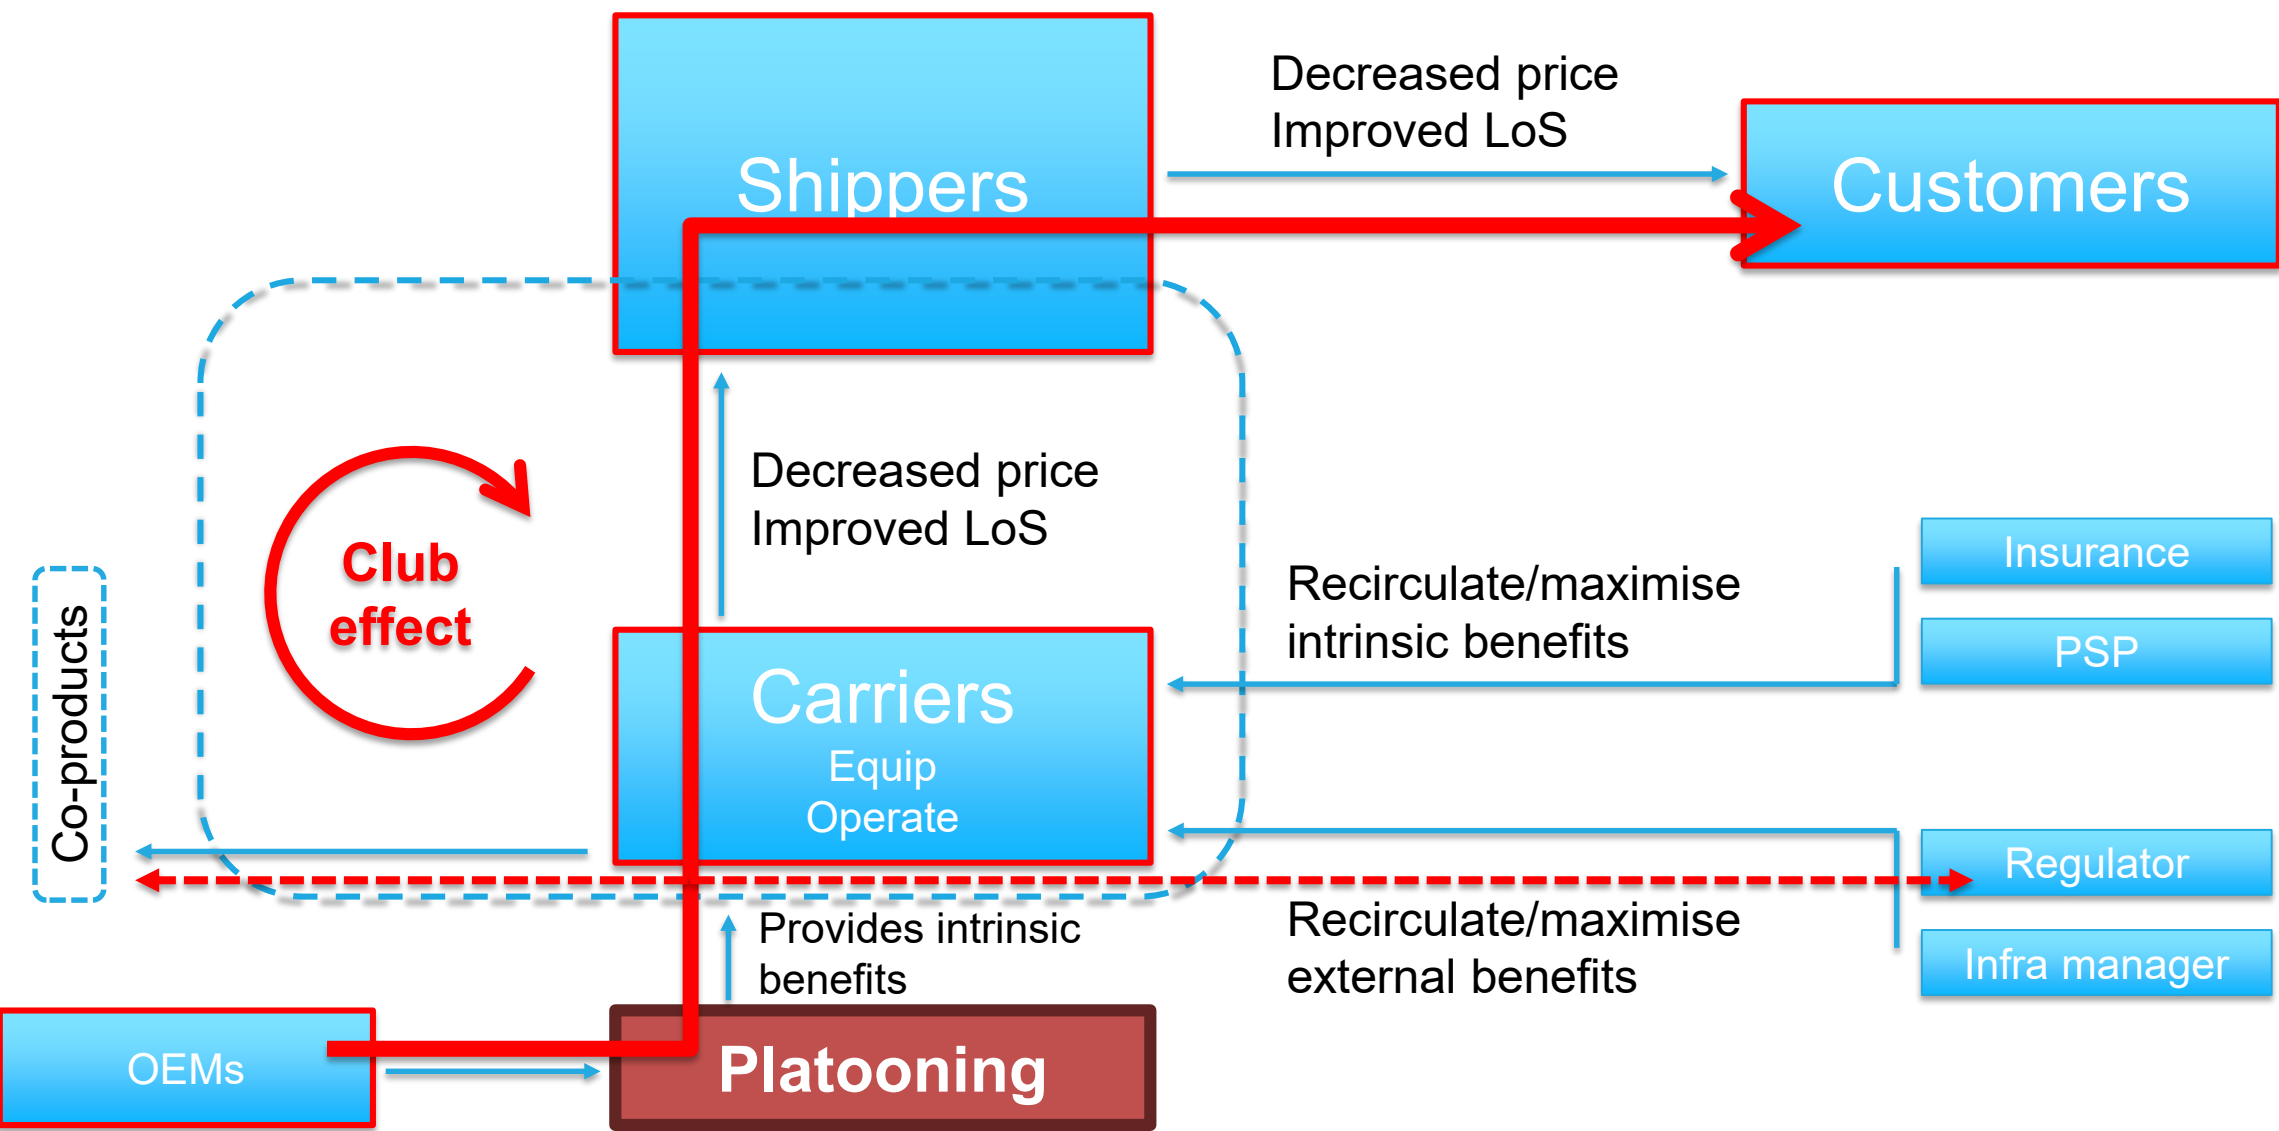

- Multi-brand platooning brings **direct financial value** when multiple trucks are together in a platoon, due to:
 - Fuel savings
 - Workforce cost savings in case of partial automation
- Platooning is costly:
 - Equipment costs
 - **Coordination costs**
- The balance must be positive

A complex eco-system...

...but a simple value chain

Market uptake

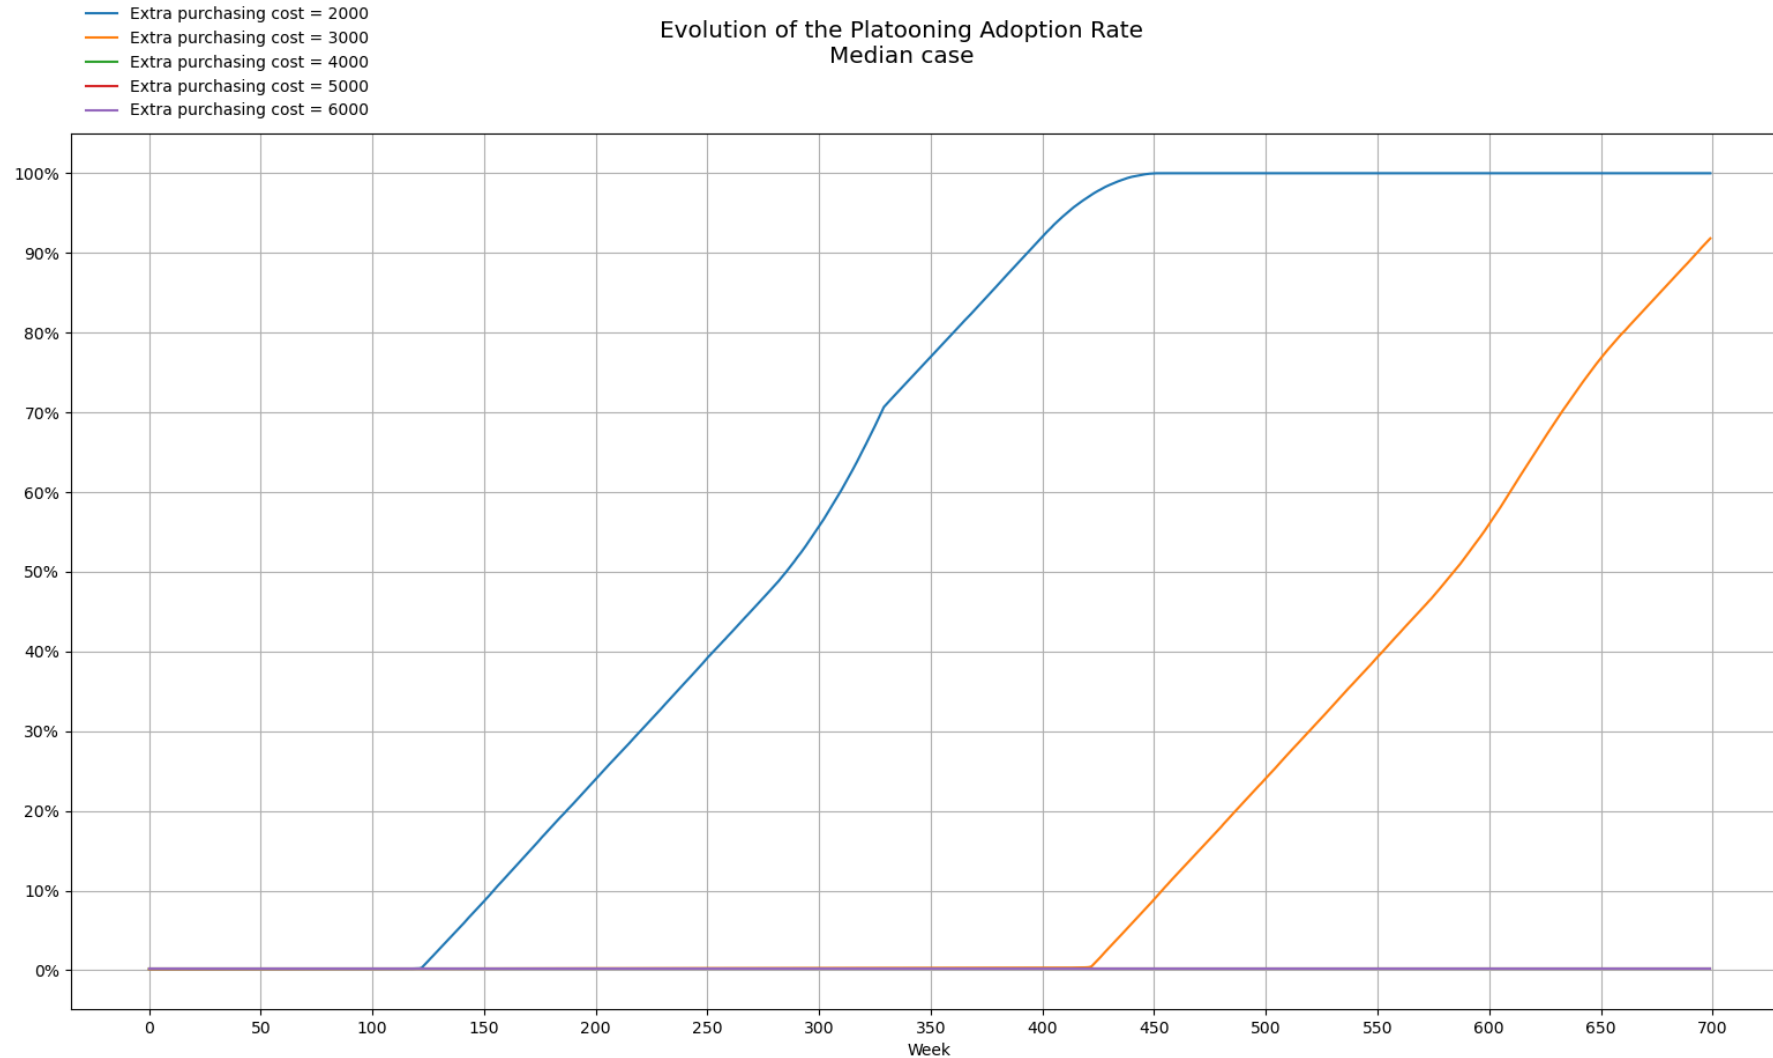

- Two layer of decisions are accounted for
 - 1: platoon formation
 - 2: vehicle equipment
- Two set of assumptions are compared
 - 1: platooning support function (5% fuel savings for following vehicles)
 - 2: platooning autonomous function (0%/10% fuel savings for following vehicles)

- Two layer of decisions are accounted for
 - 1: platoon formation
 - 2: vehicle equipment
- Two set of assumptions are compared
 - 1: platooning support function (5% fuel savings for following vehicles)
 - 2: platooning autonomous function (0%/10% fuel savings for following vehicles)
- **There is no business case for the platooning support function**

- Two layer of decisions are accounted for
 - 1: platoon formation
 - 2: vehicle equipment
- Two set of assumptions are compared
 - 1: platooning support function (5% fuel savings for following vehicles)
 - 2: platooning autonomous function (0%/10% fuel savings for following vehicles)
- **There is no business case for the platooning support function**
- **There is a business case for the platooning autonomous function**

Platooning autonomous function: market uptake

Platooning autonomous function: market uptake

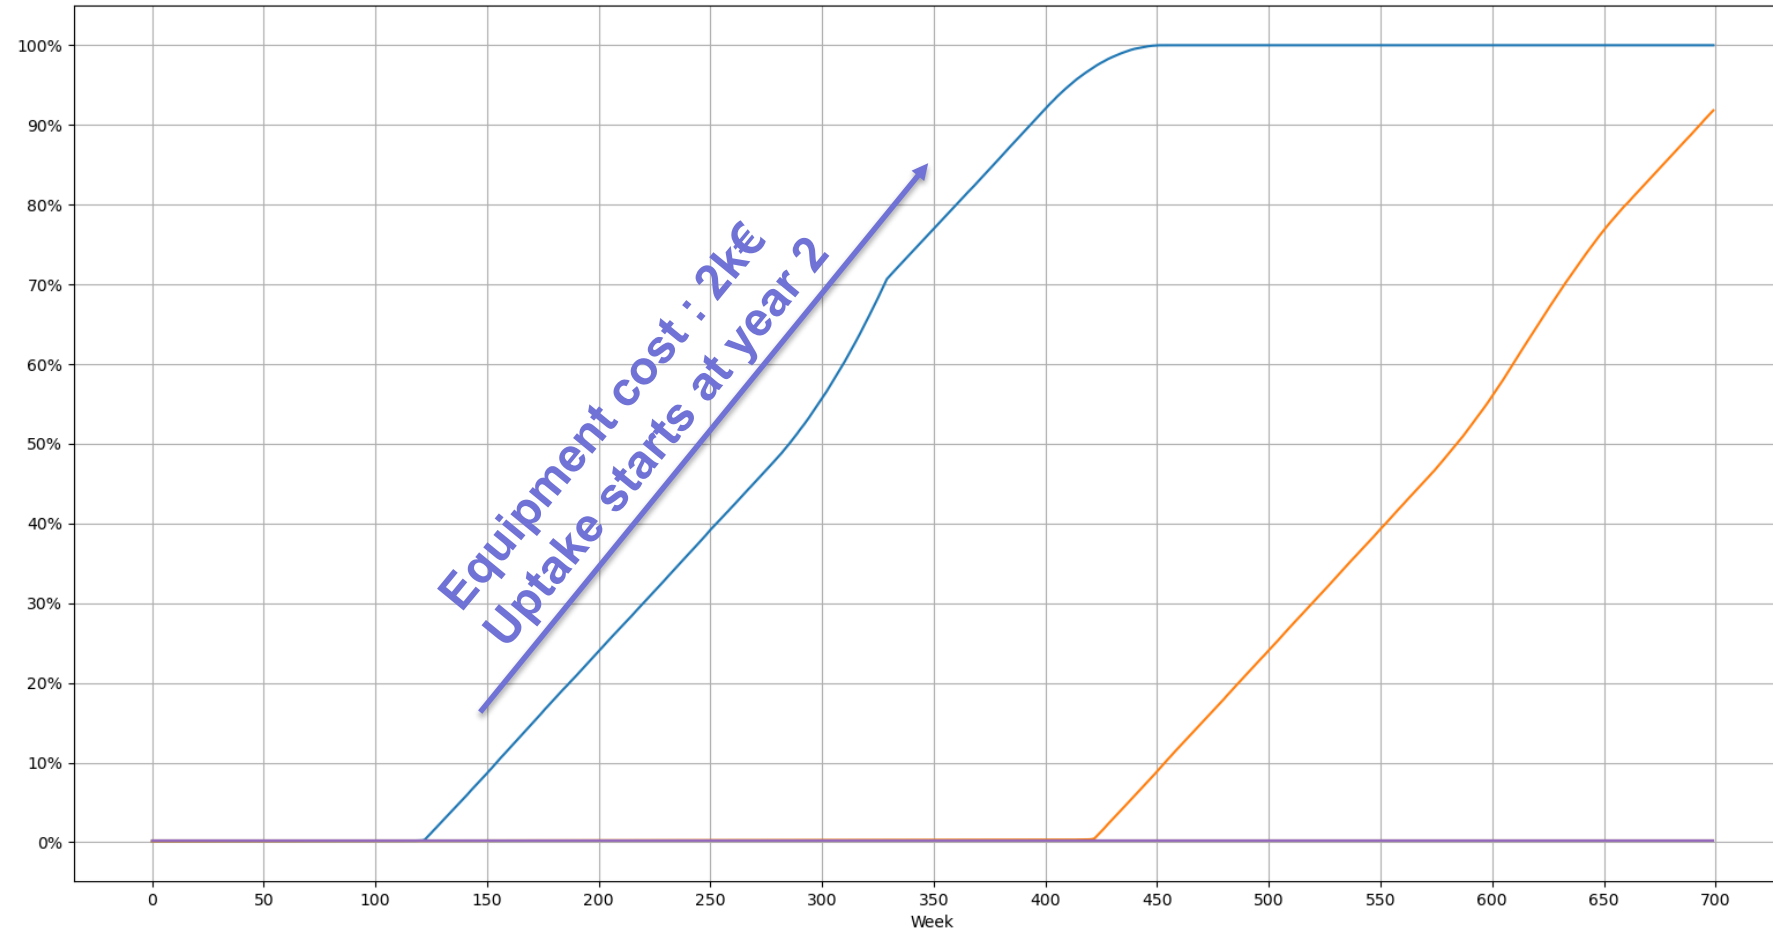

Platooning autonomous function: market uptake

- Extra purchasing cost = 2000
- Extra purchasing cost = 3000
- Extra purchasing cost = 4000
- Extra purchasing cost = 5000
- Extra purchasing cost = 6000

Evolution of the Platooning Adoption Rate
Median case

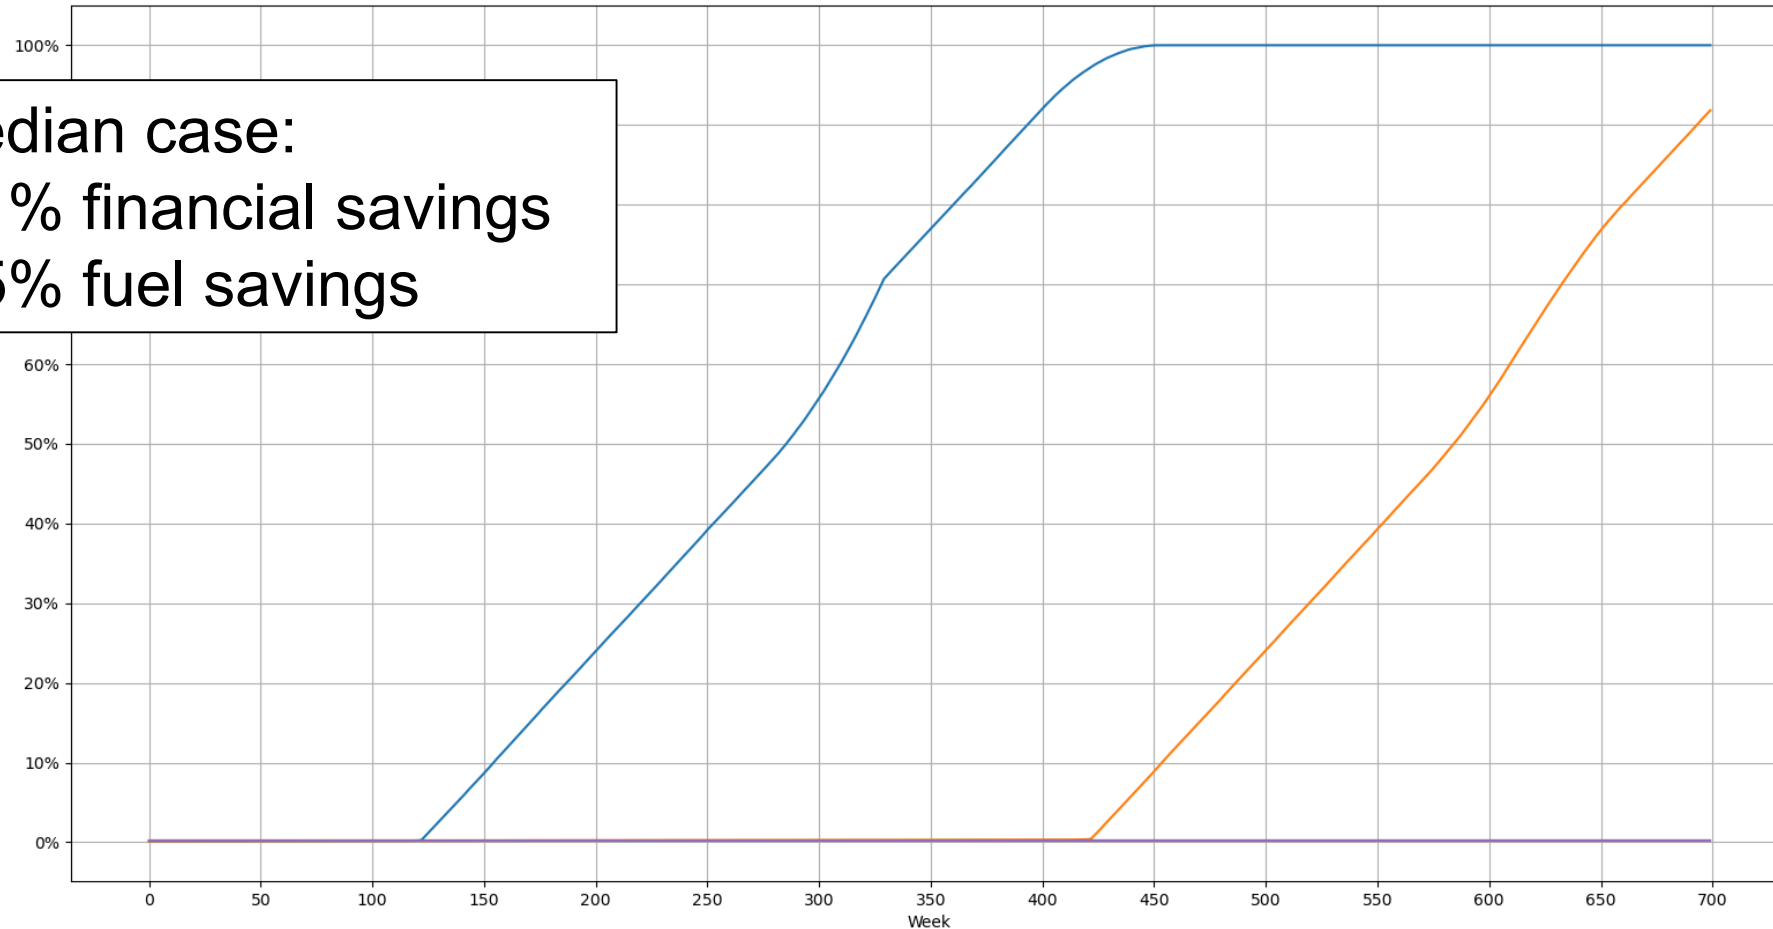

Platooning autonomous function: market uptake

- Extra purchasing cost = 2000
- Extra purchasing cost = 3000
- Extra purchasing cost = 4000
- Extra purchasing cost = 5000
- Extra purchasing cost = 6000

Evolution of the Platooning Adoption Rate
Median case

Median case:
~1% financial savings
~5% fuel savings

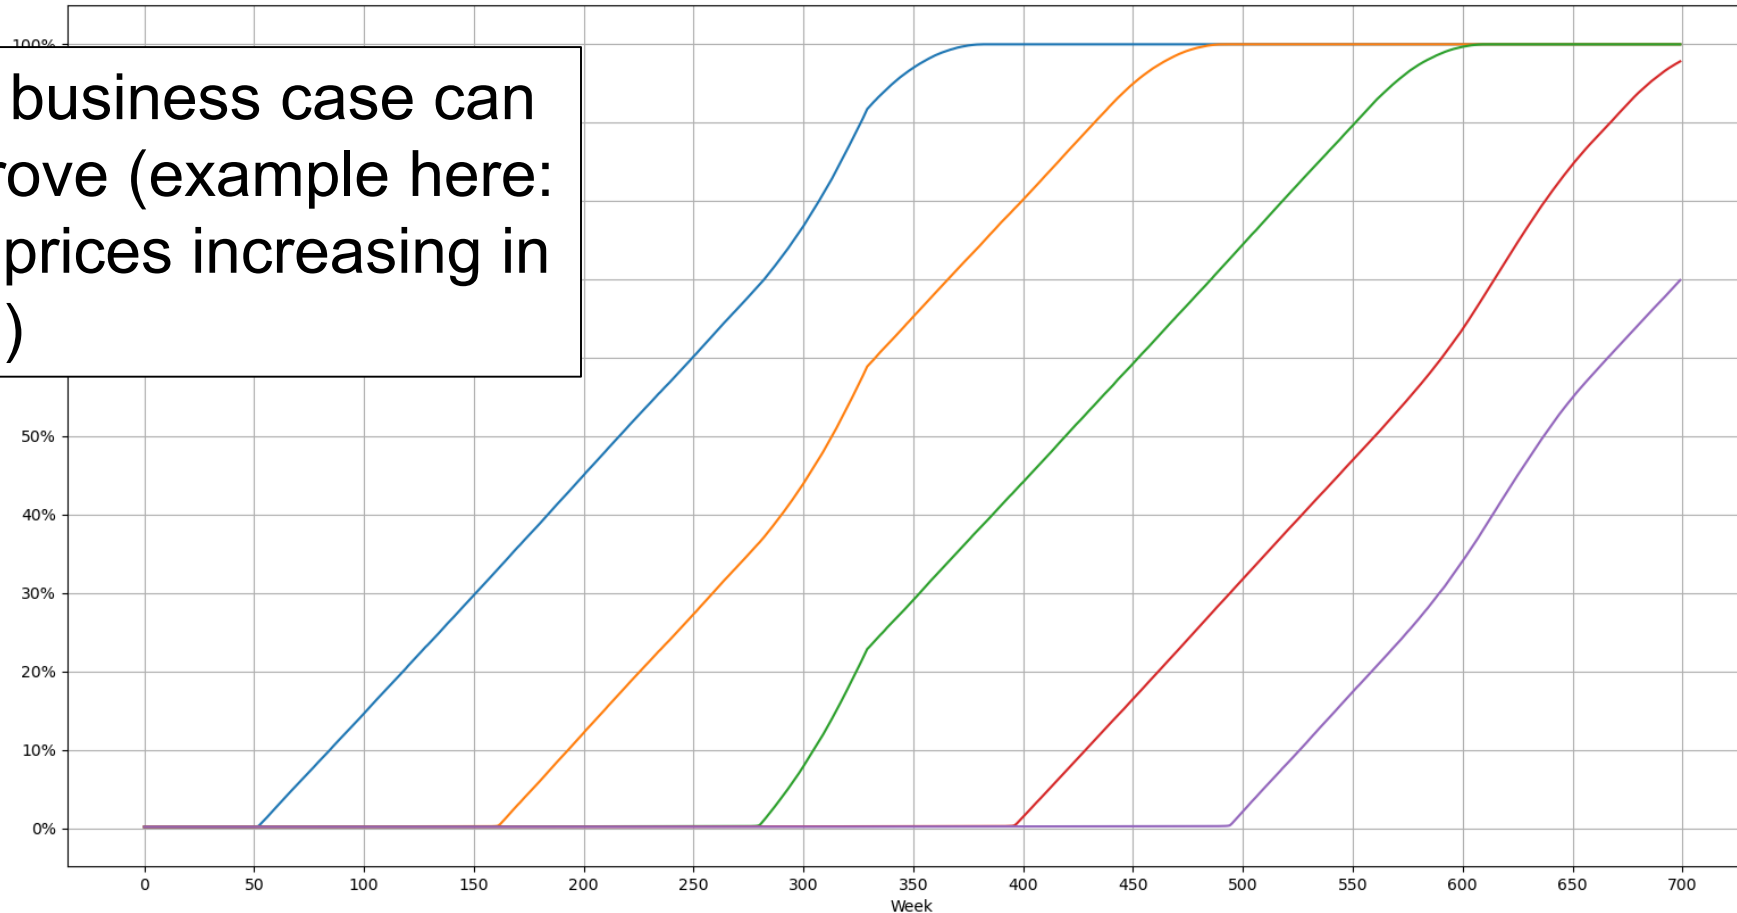

Sensitivity test: increasing fuel prices

Evolution of the Platooning Adoption Rate
5% fuel price increase

- Extra purchasing cost = 2000
- Extra purchasing cost = 3000
- Extra purchasing cost = 4000
- Extra purchasing cost = 5000
- Extra purchasing cost = 6000

The business case can improve (example here: fuel prices increasing in time)

Main conclusions

- The benefits of platooning depend on how often a truck is in a platoon, and for how long
- There is a coordination cost of platooning
 - There are network externalities
 - Interoperability is critical
 - The net benefits of platooning are lower than the gross benefits
- With the Platooning Support Function, there is no business case
- With the Platooning Autonomous Function, there is a business case

Thank you for your attention
